

Telco cloud: Why it hasn't delivered and what needs to change for 5G

Telco cloud was meant to change the way telcos operate and unlock key benefits

But telcos have struggled to do this due to flawed approaches to deployment

Multi-vendor telco cloud is the preferred goal but barriers need to be overcome

Need for internal transformation

- Leadership commitment to make change happen
- Acquiring the right skillsets and culture
- Defining and quantifying what success looks like

Need to foster collaboration & integration

- All elements, whether new or legacy, need to co-exist harmoniously
- Requires significant cross-industry collaboration

Need to balance standards & blueprints

- Standards bodies (e.g. ETSI) have driven efforts to develop standards and blueprints
- But still lagging behind realities and telco needs

Need for better management & orchestration capabilities

- Need MANO solutions to provide visibility and control over networks
- Required to remove need to deploy vertically-integrated stacks

Need for vendors to partner & pre-integrate

- Vendors need to help operators with their goals
- Joint propositions and pre-integrated solutions help those without resource for DIY platform-approach to achieve goal

The findings are based on primary research with over 20 operators globally, conducted by **STL Partners**, in partnership with **Juniper Networks**.
